

Product name:
Hopes Law Apparatus

Product code:
CIVIL-HET-123-0002

Description

Hopes Law Apparatus

Technical specification

The water above continues to cool until it freezes, then the ice provides an insulating layer that keeps the denser water beneath from cooling as quickly.

show that water has a maximum density at 4°C. In winter, ponds and lakes are cooled from above.

Convection then occurs throughout until a dense layer of water at 4°C forms on the bottom.

The comparatively warm layer on the bottom enables aquatic life to survive.

Were water not to have its maximum density at a temperature above its freezing point, then ponds and lakes would freeze throughout and, because heat conduction between air and ice is such a slow process, possibly fail to thaw even during the summer months.
